

Meeting rooms are often equipped with standard wired microphones that can be mixed using the RDL RU-MX4. The addition of wireless microphones to the usual complement of wired mics requires additional inputs on the mixer. The RU-MX4L mixer can be bussed together (audio and power) with the existing RU-MX4. This provides additional line level inputs (each either balanced or unbalanced) that may be fed from wireless mic receivers. The RU-MX4L provides separate gain controls for each wireless input as well as a dual-LED meter for each source. The compressor/limiter (if switched on) in the RU-MX4 provides output overload protection for the final mixed signal from both mixers.
